Note: Q4 2023 data in this report is preliminary. As of Q3 2023, the total NAV of included funds was \$4.0 trillion.

For further data and metrics available with PitchBook's private capital fund performance and benchmarking, please refer to our [PitchBook Benchmarks report](#).

# Overview

## What are the PitchBook Private Capital Indexes?

The PitchBook Private Capital Indexes are quarterly return benchmarks for the private market industry. These indexes are built with PitchBook's fund cash flow and net asset value (NAV) data and serve as a supplement to our quarterly [PitchBook Benchmarks report](#).

This report is organized into sections for each of the seven strategies, with subcategories within private equity, venture capital, real estate, real assets, private debt, and funds of funds. We also track returns by fund quartile ranking, bucketed according to a fund's class and vintage year benchmark. For the overall Private Capital Index, we include versions by global region. These various combinations provide an overall view of private market performance by money-weighting the cash flows and NAV changes of active funds in a respective fund category.

Our Benchmarks report has been providing quarterly returns since 2018, with our data series extending back to the late 90s. By calculating the change in NAV from one quarter to the next, adjusting for cash flows coming into and out of funds via capital calls and distributions, we can get a sense of each asset class's performance in a pseudo-time-weighted manner. Linking the quarterly return figures allows us to construct an index, providing a useful alternative comparison with other portfolio holdings such as public markets.

Additionally, the indexes unlock useful analysis on private market volatility and drawdowns during difficult environments. One known limitation of private market performance and risk measurement is the tendency for fund returns to appear overly "smooth," with asset pricing slow to change from one period to the next. This smoothing results in lower perceived volatility than what is likely realistic, which can impact diversification decisions and risk/reward estimations based on reported returns. To address this limitation, this report includes adjusted returns for private market risk measurement.

PitchBook clients have access to all the aggregate data in [the accompanying XLS](#), as well as the underlying constituent funds in the PitchBook Platform. Please reach out with any questions or feedback.

The indexes provided are meant to be estimates of asset class performance, hypothetically creating a return if one had access to all active funds on a capital-weighted basis.<sup>1</sup> They are not practically investable and are subject to change as we continually update our datasets.

## PitchBook Private Capital Indexes 5-year return

Source: PitchBook • Geography: Global • \*As of December 31, 2023

<sup>1</sup>: Specifically, we include active funds for which PitchBook has adequate returns history. As of Q3 2023, the total NAV of included funds was \$4.0 trillion.

### Private Capital Index 5-year return by fund quartile

Source: PitchBook • Geography: Global • \*As of December 31, 2023

Note: Constituent funds are bucketed into quartile rankings based on their fund categorization and vintage year. Quartiles are determined by TVPI as of the most recent available data.

### Private Capital Index quarterly return by source

### Private Capital Indexes annualized returns\*

Index	1-year	5-year	10-year	15-year
Private equity	8.4%	17.1%	15.4%	14.8%
Venture capital	-4.7%	14.1%	13.3%	12.4%
Real estate	-0.9%	8.8%	9.6%	6.5%
Real assets	12.0%	8.8%	7.7%	7.8%
Private debt	11.5%	8.4%	8.3%	10.4%
Funds of funds	6.4%	14.5%	13.5%	11.8%
Secondaries	8.8%	14.6%	13.3%	12.4%
<b>Private capital</b>	<b>7.6%</b>	<b>13.8%</b>	<b>12.7%</b>	<b>12.4%</b>

Source: PitchBook • Geography: Global • \*As of December 31, 2023

Note: Net cash flows include distributions received by LPs and contributions sent to GPs for investment. NAV change captures the unrealized markups (or markdowns) after those cash flows have been factored in.

### Private Capital Index 5-year return by region

Source: PitchBook • Geography: Global • \*As of December 31, 2023

Note: The regional breakouts are based on known fund locations.

### Private Capital Index weighting by category

### Private Capital Index weighting by region

Source: PitchBook • Geography: Global • \*As of September 30, 2023

Note: Fund weightings in each period are determined by the NAV captured from active funds. As of Q3 2023, the total NAV of active funds was \$4.0 trillion.

# Risk measurement

## Adjusting for return smoothing

Interpreting interim returns for private markets can be challenging due to the inherent smoothing that takes place as a result of infrequent and disparate valuation adjustments to a fund's assets. This smoothing produces a potential bias in estimating volatility and correlations, which are necessary inputs for many allocators' risk modeling in portfolio construction and monitoring. If left unadjusted, our indexes are subject to this bias.

To address the issue, we have used a common approach to desmooth private market returns. This section provides adjusted return series using a first-order autoregression model. In simple terms, we have found evidence that private market returns are correlated from one quarter to the next by about 50%, although this varies across asset classes and time.

By using a single-lag autocorrelation function (ACF), the adjusted return series yields higher volatility estimates than would be calculated using the traditional reported figures. The adjusted series should be taken into consideration when evaluating the risk/return characteristics of each asset class. Importantly, these are still just estimates of what the "true" returns of the asset class are, but they nonetheless provide a useful barometer for comparison.

We also display the reported and adjusted volatility estimates for each private fund asset class and correlations between the desmoothed quarterly returns and the quarterly returns of select public market indexes. If the ACF adjustments are not made, the private market asset classes will appear more attractive on a risk-adjusted basis because of the understated volatility measures. The correlations between the Private Capital Indexes and public markets may also be lower, potentially overstating the diversification benefits. We provide historical context on how the relationship with public equities has changed, as well as the overall correlation coefficients since 2000.

The following page also includes peak-to-trough drawdowns in the unadjusted reported returns during select time frames. We leave these unadjusted to recognize the magnitude of the reported NAV change experienced by LPs through the market downturn. While not necessarily indicative of volatility, the drawdowns provide historical context to answer the question, "How much do reported NAVs fall during a correction?" This provides a starting point for considering the impact of various environments on a private market portfolio.

For further reading on fund return smoothing, please review our [Analyst Note: Return Smoothing in Private Markets](#).

# Appendix

## Glossary

### Autocorrelation function (ACF)

The measurement of correlation between a lagged version of a variable as compared with its original version between two successive time intervals. The ACF quantifies the extent to which the values of a time series are linearly related to their own past values.

### Contributions

The capital provided by the LP to the GP once the GP has identified an asset or assets it intends to acquire. Contributions differ from committed capital in that committed capital is the full amount that an LP has legally agreed to contribute to the fund over the course of the fund life. LPs provide contributions only when a GP calls down capital, which it typically does several times over the life of the fund.

### Desmoothed returns

Because the true value of private portfolio companies is often unknown, private market returns are often estimated using fair value accounting, resulting in conservative valuation estimates. These conservative valuation estimates result in artificially smoothed reported returns that underestimate the volatility that private funds experience. This also results in a tendency for returns to be autocorrelated. To desmooth the return series, an adjustment is made to the reported returns using a one-period ACF to more accurately reflect volatility.

### Distributions

The capital returned to an LP from the GP after the fund exits an investment or as the fund's assets produce income.

### Net asset value (NAV)

NAV is the remaining value of a fund at a given point in time. It is the value of the assets in a fund that have not yet been realized. NAV will typically rise early in a fund's life as capital is called down by the GP and invested. As the fund exits investments and distributes capital to its LPs, or if the fund's investments are marked down, the NAV will decrease.

### Quarterly return

Calculated as the percentage change in aggregate NAV for a group of funds, considering contributions and distributions during the quarter. This makes the calculation tantamount to a quarterly compounded growth rate.

$$\text{Quarterly return} = \left[ \frac{\left( \text{NAV at end of quarter} + \text{distributions during the quarter} - \text{contributions during the quarter} \right)}{\text{NAV at the beginning of the quarter}} \right] - 1$$

### Total value to paid-in (TVPI) multiple

A measurement of both the realized and unrealized value of a fund as a proportion of the total paid-in (contributed) capital.

### Vintage year

The vintage year is based on the year that a fund makes its first capital call. If the year of the initial call is unknown, the year of the final close is used as the vintage year. However, if a firm publicly declares via press release or marketing materials a fund to be of a particular vintage that is different than either of the first conditions, the firm's classification takes precedence.
